

BOTOX FOR HYPERHIDROSIS (EXCESSIVE SWEATING)

BOTOX® Medical has been used to address hyperhidrosis (excessive sweating) for over 20 years with great success. As an alternative to chemical topical antiperspirants, BOTOX® is safe and highly effective. We use BOTOX® for sweat management on the under arms, forehead, and scalp. BOTOX® Medical may be covered by private insurance plans, and those who have this type of coverage often only have to pay an injection fee.

BENEFITS

- Safe with no downtime
- Excessive sweating relief into the treated area for 4-12 months

HOW IT WORKS

BOTOX® works by blocking the release of acetylcholine at the nerve endings, thus temporarily turning off the stimulation of the sweat gland. Once our physicians have determined your sweat intensity, they will decide the recommended dose of BOTOX® per area. One of our dermatologists will administer the BOTOX® to the chosen treatment area. Comfort measures, such as ice or topical numbing cream, are available as needed.

WHAT TO EXPECT

This treatment can take up to 30 minutes.

RESULTS

Most patients notice a reduction of excessive sweating in the treated area starting approximately one week after treatment. The length of "sweat-free" time is correlated to the intensity of the sweating, the size of the area, and the amount of BOTOX® used to address the condition.

RECOMMENDED SESSIONS

Most patients repeat their treatment for this condition every 4 - 9 months.

POSSIBLE DOWNTIME

- None

POST-TREATMENT CARE

- Resume normal skin care activities immediately post-treatment
